11.61 gdcmStaticAssert.h File Reference

This graph shows which files directly or indirectly include this file:

Classes

- struct gdcm::static_assert_test< x >
- struct gdcm::STATIC_ASSERTION_FAILURE< true >

Namespaces

- namespace gdcm

Macros

- #define GDCM_DO_JOIN(X, Y) GDCM_DO_JOIN2(X,Y)
- #define GDCM_DO_JOIN2(X, Y) X##Y
- #define GDCM_JOIN(X, Y) GDCM_DO_JOIN(X, Y)
- #define GDCM_STATIC_ASSERT(B)

  *The GDCM_JOIN + **LINE** is needed to create a uniq identifier.*

11.61.1 Macro Definition Documentation

11.61.1.1 GDCM_DO_JOIN

```
#define GDCM_DO_JOIN(
              X,
              Y ) GDCM_DO_JOIN2(X,Y)
```

11.61.1.2 GDCM_DO_JOIN2

```
#define GDCM_DO_JOIN2(
              X,
              Y ) X##Y
```

11.61.1.3 GDCM_JOIN

```
#define GDCM_JOIN(
              X,
              Y ) GDCM_DO_JOIN( X, Y )
```

11.61.1.4 GDCM_STATIC_ASSERT

```
#define GDCM_STATIC_ASSERT(
              B )
```

Value:

```
typedef ::gdcm::static_assert_test<\
  sizeof(::gdcm::STATIC_ASSERTION_FAILURE< (bool)( B ) >)>\
    GDCM_JOIN(gdcm_static_assert_typedef_, __LINE__)
```

The GDCM_JOIN + **LINE** is needed to create a uniq identifier.

11.79.1 Macro Definition Documentation

11.79.1.1 GDCM_FUNCTION

```
#define GDCM_FUNCTION "<unknown>"
```

11.79.1.2 gdcmAssertAlwaysMacro

```
#define gdcmAssertAlwaysMacro(
            arg ) gdcmAssertMacro(arg)
```

AssertAlways.

Parameters

arg	argument to test An easy solution to pass also a message is to do: gdcmAssertMacro("my message" && 2 < 3)

11.79.1.3 gdcmAssertMacro

```
#define gdcmAssertMacro(
            arg )
```

Value:

```
{                                                                   \
   if( !(arg) )                                                     \
   {                                                                \
   std::ostringstream osmacro;                                      \
   osmacro « "Assert: In " __FILE__ ", line " « __LINE__          \
           « ", function " « GDCM_FUNCTION                         \
           « "\n\n";                                                \
   std::ostream &_os = gdcm::Trace::GetErrorStream();               \
   _os « osmacro.str() « std::endl;                                \
   assert ( arg );                                                  \
   }                                                                \
}                                                                   \
GDCM_NOOP_STATEMENT
```

Assert.

Parameters

arg	argument to test An easy solution to pass also a message is to do: gdcmAssertMacro("my message" && 2 < 3)

11.79.1.4 gdcmDebugMacro

```
#define gdcmDebugMacro(
            msg )
```

Value:

```
{                                                                   \
   if( gdcm::Trace::GetDebugFlag() )                                \
   {                                                                \
   std::ostringstream osmacro;                                      \

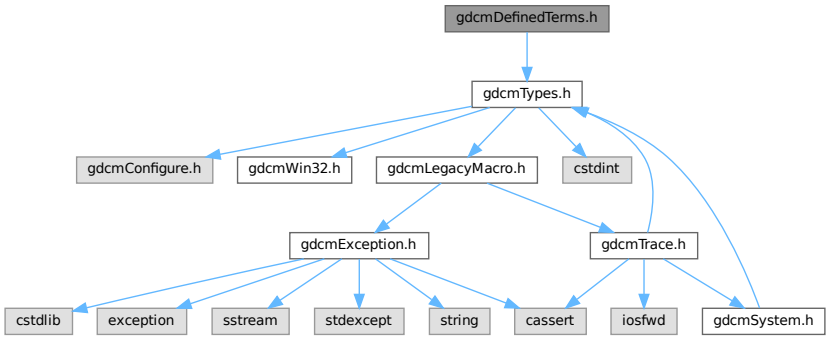
11.199 gdcmDefinedTerms.h File Reference

`#include "gdcmTypes.h"`

Include dependency graph for gdcmDefinedTerms.h:



Classes

- class gdcm::DefinedTerms

  Defined Terms are used when the specified explicit Values may be extended by implementors to include additional new Values. These new Values shall be specified in the Conformance Statement (see PS 3.2) and shall not have the same meaning as currently defined Values in this standard. A Data Element with Defined Terms that does not contain a Value equivalent to one of the Values currently specified in this standard shall not be considered to have an invalid value. Note: Interpretation Type ID (4008,0210) is an example of a Data Element having Defined Terms. It is defined to have a Value that may be one of the set of standard Values; REPORT or AMENDMENT (see PS 3.3). Because this Data Element has Defined Terms other Interpretation Type IDs may be defined by the implementor.

}
```

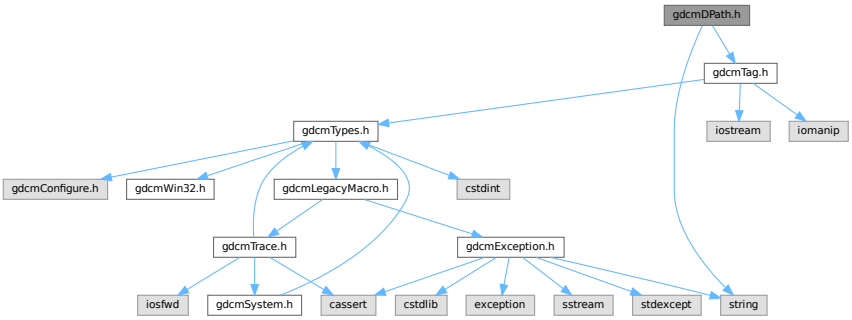
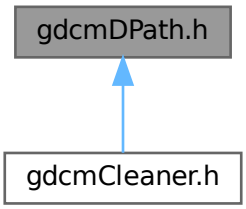
11.283 gdcmDPath.h File Reference

```
#include "gdcmTag.h"
#include <string>
```

Include dependency graph for gdcmDPath.h:



This graph shows which files directly or indirectly include this file:



Classes

- class gdcm::DPath

  class to handle a DICOM path While supp 118 did introduced a notion of XPath for XML Native model this convention is too XML-centric. Instead prefer DCMTK style notation `https://groups.google.com/g/comp.protocols.↩dicom/c/IyIH0IOBMPA`

Namespaces

- namespace gdcm

Functions

- std::ostream & gdcm::operator<< (std::ostream &os, const DPath &val)

11.284 gdcmDPath.h

 * Typically will look like:
 * [ORIGINAL\PRIMARY\OTHER]
 * If a non printable character is found: RED and INVERSE is used:
 * [                .]
 *
 * when the VR is not found (file or dict), we check if we can print the output:
 * on success ASCII mode is used, on failure the output is printed a series of bytes
 *
 * Special case when the data element is empty:
 * INVERSE « (no value)
 *
 * retired public element are printed in red and underline
 * unknown private element are printed in RED followed by 'UNKNOWN'
 *
 * Correct VR is printed in green just after the found VR
 *
 * length of data element is printed in bytes, followed by the VM, a green VM is appended
 * if this is not compatible
 */

/*
The NetworkEvents enumeration defines the inputs into the state of the network connection.

These inputs can come either from user input or input from other things on the socket,
ie, responses from the peer or ARTIM timeouts.

Note that this enumeration is not 'power of two', like the states, because you can't have
multiple simultaneous events.  Multiple state outputs in transition tables, however, is possible.

=========================================================================*/
// .NAME vtkGDCMImageReader - read DICOM Image files (Pixel Data)
// .SECTION Description
// vtkGDCMImageReader is a source object that reads some DICOM files
// this reader is single threaded.
// .SECTION Implementation note: when FileLowerLeft is set to on the image is not flipped
// upside down as VTK would expect, use this option only if you know what you are doing.
// .SECTION Implementation note: when reading a series of 2D slices, user is
// expected to provide an ordered list of filenames. No sorting will be applied afterward.
// .SECTION Implementation note: Although 99% of the time the Zspacing as read
// from a tag in a 2D DICOM file should be correct, there has been reports that this
// value can be missing, or incorrect, in which case users are advised to override this
// value using the return value from gdcm::IPPSorter::GetZSpacing() and set it via
// vtkImageChangeInformation on the reader itself.
// .SECTION TODO
// This reader does not handle a series of 3D images, only a single 3D (multi frame) or a
// list of 2D files are supported for now.
// .SECTION TODO
// Did not implement SetFilePattern / SetFilePrefix API, move it to protected section for now.
// .SECTION BUG
// Overlay are assumed to have the same extent as image. Right now if overlay origin is not
// 0,0 the overlay will have an offset...
// Only the very first overlay is loaded at the VTK level, for now (even if there are more than one in the file)
// .SECTION DataOrigin
// When the reader is instantiated with FileLowerLeftOn the DataOrigin and Image Position (Patient) are
// identical. But when FileLowerLeft is Off, we have to reorder the Y-line of the image, and thus the DataOrigin
// is then translated to the other side of the image.
// .SECTION Spacing
// When reading a 3D volume, the spacing along the Z dimension might be negative (so as to respect up-side-down)
// as specified in the Image Orientation (Patient) tag. When Z-spacing is 0, this means the multi-frame object
// contains image which do not represent uniform volume.
// .SECTION Warning
// When using vtkGDCMPolyDataReader in conjunction with vtkGDCMImageReader
```

```
// it is *required* that FileLowerLeft is set to ON as coordinate system
// would be inconsistent in between the two data structures.
// .SECTION Color Space mapping:
// * VTK_LUMINANCE         <-> MONOCHROME2
// * VTK_LUMINANCE_ALPHA   <-> Not supported
// * VTK_RGB               <-> RGB
// * VTK_RGBA              <-> ARGB (deprecated, DICOM 2008)
// * VTK_INVERSE_LUMINANCE <-> MONOCHROME1
// * VTK_LOOKUP_TABLE      <-> PALETTE COLOR
// * VTK_YBR               <-> YBR_FULL
//

=========================================================================*/
// .NAME vtkGDCMImageReader2 - read DICOM Image files (Pixel Data)
// .SECTION Description
// vtkGDCMImageReader2 is a source object that reads some DICOM files
// this reader is single threaded.
// .SECTION Implementation note: when FileLowerLeft is set to on the image is not flipped
// upside down as VTK would expect, use this option only if you know what you are doing.
// .SECTION Implementation note: when reading a series of 2D slices, user is
// expected to provide an ordered list of filenames. No sorting will be applied afterward.
// .SECTION Implementation note: Although 99% of the time the Zspacing as read
// from a tag in a 2D DICOM file should be correct, there has been reports that this
// value can be missing, or incorrect, in which case users are advised to override this
```

```
// value using the return value from gdcm::IPPSorter::GetZSpacing() and set it via
// vtkImageChangeInformation on the reader itself.
// .SECTION TODO
// This reader does not handle a series of 3D images, only a single 3D (multi frame) or a
// list of 2D files are supported for now.
// .SECTION TODO
// Did not implement SetFilePattern / SetFilePrefix API, move it to protected section for now.
// .SECTION BUG
// Overlay are assumed to have the same extent as image. Right now if overlay origin is not
// 0,0 the overlay will have an offset...
// Only the very first overlay is loaded at the VTK level, for now (even if there are more than one in the file)
// .SECTION DataOrigin
// When the reader is instantiated with FileLowerLeftOn the DataOrigin and Image Position (Patient) are
// identical. But when FileLowerLeft is Off, we have to reorder the Y-line of the image, and thus the DataOrigin
// is then translated to the other side of the image.
// .SECTION Spacing
// When reading a 3D volume, the spacing along the Z dimension might be negative (so as to respect up-side-down)
// as specified in the Image Orientation (Patient) tag. When Z-spacing is 0, this means the multi-frame object
// contains image which do not represent uniform volume.
// .SECTION Warning
// When using vtkGDCMPolyDataReader in conjunction with vtkGDCMImageReader2
// it is *required* that FileLowerLeft is set to ON as coordinate system
// would be inconsistent in between the two data structures.
// .SECTION Color Space mapping:
// * VTK_LUMINANCE         <-> MONOCHROME2
// * VTK_LUMINANCE_ALPHA   <-> Not supported
// * VTK_RGB               <-> RGB
// * VTK_RGBA              <-> ARGB (deprecated, DICOM 2008)
// * VTK_INVERSE_LUMINANCE <-> MONOCHROME1
// * VTK_LOOKUP_TABLE      <-> PALETTE COLOR
// * VTK_YBR               <-> YBR_FULL
//
// For detailed information on color space transformation and true lossless transformation see:

// .NAME vtkGDCMImageWriter - write DICOM files
```

```
// .SECTION Description
// vtkGDCMImageWriter is a sink object that write DICOM files
// this writer is single threaded (see vtkGDCMThreadedImageReader2 for multi-thread)
//
// .SECTION Warning: vtkLookupTable from the vtkImageData object taken into account
// only if ImageFormat is set to VTK_LOOKUP_TABLE
//
// .SECTION NOTE We are not using the usual API SetFilePrefix / SetFilePattern,
// but instead a list of filenames: see SetFileNames and class gdcm::FilenameGenerator
//
// .SECTION Warning
// You need to specify the correct ImageFormat (taken from the reader)
// You need to explicitly specify the DirectionCosines (taken from the reader)
// Since VTK 5.4 vtkMedicalImageProperties has its own DirectionCosine (no 's')
// user need to make sure the vtkMatrix4x4 is compatible with the 6-vector DirectionCosine.
//
// .SECTION NOTE Shift/Scale are global to all DICOM frames (=files) written
// as 2D slice, therefore the shift/scale operation might not be optimized for
// all slices. This is not recommended for image with a large dynamic range.
//
// .SECTION See Also

// .NAME vtkGDCMThreadedImageReader2 - read DICOM files with multiple threads
// .SECTION Description
// vtkGDCMThreadedImageReader2 is a source object that reads some DICOM files
// This reader is threaded. Meaning that on a multiple core CPU with N cpu, it will
// read approx N times faster than when reading in a single thread assuming the IO is
// not a bottleneck operation.
// If looking for a single threaded class see: vtkGDCMImageReader
//
// .SECTION Warning: Advanced users only. Do not use this class in the general case,
// you have to understand how physically medium works first (sequential reading for
// instance) before playing with this class
//
// .SECTION Implementation note: when FileLowerLeft is set to on the image is not flipped
// upside down as VTK would expect, use this option only if you know what you are doing
//
// .SECTION FIXME: need to implement the other mode where FileLowerLeft is set to OFF
//
// .SECTION FIXME: need to implement reading of series of 3D files
//
// .SECTION Implementation note: this class is meant to supersede vtkGDCMThreadedImageReader
// because it had support for ProgressEvent support even from python layer. There is a
// subtle trick down in the threading mechanism in VTK were the main thread (talking to the
// python interpreter) is also part of the execution process (and the N-1 other thread
// are just there to execute the remaining of ThreadedRequestData), this separation into
// two types of thread is necessary to achieve a working implementation of UpdateProgress

=========================================================================*/
// .NAME vtkImageColorViewer - Display a 2D image.
// .SECTION Description
// vtkImageColorViewer is a convenience class for displaying a 2D image.  It
// packages up the functionality found in vtkRenderWindow, vtkRenderer,
// vtkImageActor and vtkImageMapToWindowLevelColors into a single easy to use
// class.  This class also creates an image interactor style
// (vtkInteractorStyleImage) that allows zooming and panning of images, and
// supports interactive window/level operations on the image. Note that
// vtkImageColorViewer is simply a wrapper around these classes.
//
// vtkImageColorViewer uses the 3D rendering and texture mapping engine
// to draw an image on a plane.  This allows for rapid rendering,
// zooming, and panning. The image is placed in the 3D scene at a
// depth based on the z-coordinate of the particular image slice. Each
// call to SetSlice() changes the image data (slice) displayed AND
// changes the depth of the displayed slice in the 3D scene. This can
// be controlled by the AutoAdjustCameraClippingRange ivar of the
// InteractorStyle member.
//
// It is possible to mix images and geometry, using the methods:
//
// viewer->SetInput( myImage );
// viewer->GetRenderer()->AddActor( myActor );
//
// This can be used to annotate an image with a PolyData of "edges" or
// or highlight sections of an image or display a 3D isosurface
// with a slice from the volume, etc. Any portions of your geometry
// that are in front of the displayed slice will be visible; any
```

```
// portions of your geometry that are behind the displayed slice will
// be obscured. A more general framework (with respect to viewing
// direction) for achieving this effect is provided by the
// vtkImagePlaneWidget .
//
// Note that pressing 'r' will reset the window/level and pressing
// shift+'r' or control+'r' will reset the camera.

    }

  return r;
}
```

12.5 TestReader.py

This is a C++ example on how to use gdcm::Reader

```
00001
00014
00015 import os,sys
00016 import gdcm
00017
00018 def TestRead(filename, verbose = False):
00019   r = gdcm.Reader()
00020   r.SetFileName( filename )
00021   success = r.Read()
00022   #if verbose: print r.GetFile()
00023   if verbose: print(r.GetFile().GetDataSet())
00024   return success
00025
00026 if __name__ == "__main__":
00027   success = 0
00028   try:
00029     filename = os.sys.argv[1]
00030     success += TestRead( filename, True )
00031   except:
00032     # loop over all files:
00033     gdcm.Trace.DebugOff()
00034     gdcm.Trace.WarningOff()
00035     t = gdcm.Testing()
00036     nfiles = t.GetNumberOfFileNames()
00037     for i in range(0,nfiles):
00038       filename = t.GetFileName(i)
00039       success += TestRead( filename )
00040
00041
00042   # Test succeed ?
00043   sys.exit(success == 0)
```

12.6 DecompressJPEGFile.cs

This is a C# example on how to use gdcm::SequenceOfFragments

```

/*
 * Description:
 *
 * Assume we have a file angiogram-06.dcm as described above.
 * the following program will decompress directly from the extracted jpeg stream.
 *
 * First step extract the jpeg stream (but not the Basic Offset Table):
 *
 * $ gdcmraw -i angiogram-06.dcm -o /tmp/output/chris --split-frags --pattern %d.jpg
 *
 * Check that indeed there are 355 files, while there are 356 fragments in the original DICOM file, since
 * gdcmraw always skip the first fragment (Basic Offset Table).
 *
 * Now from those individual jpeg stream, recreate a fake gdcm.DataElement...
 *
 * Usage:
 *
 * $ export LD_LIBRARY_PATH=$HOME/Projects/gdcm/debug-gcc/bin
 * $ mono ./bin/DecompressImageMultiframe.exe /tmp/output
 */

/*
 * Simple C# example
 *
 * Shows multiple steps:
 * Steps 1.
 * Create a fake (dummy) DICOM file, with size 512 x 512 x 2 We use a small
 * image to be able to create the volume in memory Of course you can use any
 * existing DICOM instead
 *
 * Step 2.
 * Hack the DICOM file to pretend the number of frames is 1000 (instead of 2)
 * At this point in time this makes the DICOM file invalid (truncated). But the
 * next step will fix this.
 *
 * Step 3.
 * Use C# to create a binary data which will represent our source object for
 * image.
 *
 * Step 4.
 * We use gdcm.FileStreamer to merge the template DICOM file from Step 2, with
 * the binary data from Step 3. We decide to read a scanline at a time, but
 * this can be read with any number of bytes. AppendToDataElement() will always
 * do the proper computation.
 *
 * Step 5.
 * We compress this gigantic file, into [JPEG Lossless, Non-Hierarchical,
 * First-Order Prediction (Process 14 [Selection Value 1])]
 *
 * Usage:
 * $ mono bin/FileChangeTS.exe small.dcm big.dcm raw.data merge.dcm jpeg.dcm

Question:
1.
  There is no restriction for a specific Private Creator Data Element
(PCDE) to be unique within the same group, right ?
  Decoders of Private Data would have to handle the case where a PCDE
would be repeated and should NOT stop on the first instance of a
particular PCDE, right ?

  Eg. when searching for the tag associated with
(0x0029,0x0010,"SIEMENS CSA HEADER") in the following (pseudo)
dataset:

(0029,0010) LO [SIEMENS CSA HEADER]                     #  18, 1
PrivateCreator
(0029,0011) LO [SIEMENS MEDCOM HEADER]                  #  22, 1
PrivateCreator
(0029,0012) LO [SIEMENS MEDCOM HEADER2]                 #  22, 1
PrivateCreator
(0029,0013) LO [SIEMENS CSA HEADER]                     #  18, 1

  one should return two instances, correct ?

Answer:
I would say that this is covered in principle by the PS 3.5 7.1
"The Data Elements ... shall occur at most once in a Data Set"
rule, since the data element is defined by the tuple
(private creator,gggg,ee) where xxee is the element
number and xx is arbitrary and has no inherent meaning and
does not serve to disambiguate the data element.

E.g.:

(0019,0030) Private Creator ID = "Smith"
...
(0019,0032) Private Creator ID = "Smith"
...
(0019,3015) Fractal Index = "32"
...
(0019,3215) Fractal Index = "32"
```

```
would be illegal because even though they are assigned different
(completely arbitrary) blocks, with the same group, element
number and private creator, (0019,3015) and (0019,3215) are the
"same" data element.

/*
 * This example is a little helper to detect the famous SIEMENS JPEG lossless compressed image
 * where DICOM is declared as:
 *
 *  (0028,0100) US 16                                          # 2,1 Bits Allocated
 *  (0028,0101) US 12                                          # 2,1 Bits Stored
 *  (0028,0102) US 11                                          # 2,1 High Bit
 *  (0028,0103) US 0                                           # 2,1 Pixel Representation
 *
```

```
 * But where JPEG is:
 *
 *        JPEG_SOF_Parameters:
 *                SamplePrecision = 16
 *                nLines = 192
 *                nSamplesPerLine = 192
 *                nComponentsInFrame = 1
 *                component 0
 *                        ComponentIdentifier = 1
 *                        HorizontalSamplingFactor = 1
 *                        VerticalSamplingFactor = 1
 *                        QuantizationTableDestinationSelector = 0
 *
 *
 * This case is valid. One simply has to use the 16bits jpeg decoder to decode the 12bits stored image.
 * This used to be an issue in GDCM 1.2.x (fixed in GDCM 1.2.5)
 *
 * The main return 0 (no error) when the file read is actually a potential problem. At the end of the main
 * function, the jpeg stream is stored in the filename specified as second argument
 */

/*
 * Simple example to show how to use Scanner API.
 * It exposes the three different cases:
 *  - DICOM Attribute is present and has a value
 *  - DICOM Attribute is present and has no value
 *  - DICOM Attribute is not present at all
 * It also shows the purpose of the function 'IsKey' to detect whether or
 * not the file has been read by the gdcm::Scanner. Technically most of the time
 * if a file is not a 'Key' this is because it is not a DICOM file. You need to use
 * gdcm::System::FileExists to decide whether or not the file actually exist on the disk.
```

```
 *
 * It was tested on this particular image:
 * ./SimpleScanner gdcmData/012345.002.050.dcm

/*
 * This example shows how to rewrite a ELSCINT1/PMSCT_RLE1 compressed
 * image so that it is readable by most 3rd party software (DICOM does
 * not specify this particular encoding).
 * This is required for the sake of interoperability with any standard
 * conforming DICOM system.
 *
 * Everything done in this code is for the sole purpose of writing interoperable
 * software under Sect. 1201 (f) Reverse Engineering exception of the DMCA.
 * If you believe anything in this code violates any law or any of your rights,
 * please contact us (gdcm-developers@lists.sourceforge.net) so that we can
 * find a solution.
 *
 * Everything you do with this code is at your own risk, since decompression
 * algorithm was not written from specification documents.
 *
 * Special thanks to:
 * Mauro Maiorca for bringing to our attention on this new ELSCINT1
 * compression algorithm : PMSCT_RLE1 (different from the 'LOSSLESS RICE')
 * See post at:
 * http://groups.google.com/group/comp.protocols.dicom/msg/f2b99bf706a7f8ca
 *
 * Thanks to Jesus Spinola, for more datasets,
 * http://www.itk.org/pipermail/insight-users/2008-April/025571.html
 *
 * And last but not least, a very big thank to Ivo van Poorten, without
 * whom we would still be looking at this compressed byte stream as if
 * it was RLE compressed.

12.120 ExtractImageRegion.py

```

"""

 This small code shows how to use the gdcm.ImageRegionReader API
 In this example we are taking each frame by frame and dump them to
 /tmp/frame.raw.

 Usage:
 $ ExtractImageRegion.py input.dcm

 Example:
 $ ExtractImageRegion.py gdcmData/012345.002.050.dcm
 $ md5sum /tmp/frame.raw
 d594a5e2fde12f32b6633ca859b4d4a6  /tmp/frame.raw
 $ gdcminfo --md5sum gdcmData/012345.002.050.dcm
 [...]
 md5sum: d594a5e2fde12f32b6633ca859b4d4a6
"""

import gdcm

if __name__ == "__main__":
  import sys
  filename = sys.argv[1]

  file_size = gdcm.System.FileSize(filename);

  # instantiate the reader:
  reader = gdcm.ImageRegionReader();
  reader.SetFileName( filename );

  # pull DICOM info:
```

```
if not reader.ReadInformation():
  sys.exit(1)

# store current offset:
cur_pos = reader.GetStreamCurrentPosition();

remaining = file_size - cur_pos;

print("Remaining bytes to read (Pixel Data): %d" % remaining );

# Get file infos
f = reader.GetFile();

# get some info about image
dims = gdcm.ImageHelper.GetDimensionsValue(f);
print(dims)
pf = gdcm.ImageHelper.GetPixelFormatValue (f);
pixelsize = pf.GetPixelSize();
pi = gdcm.ImageHelper.GetPhotometricInterpretationValue(f);
print( pi );

# buffer to get the pixels
buffer = bytearray( dims[0] * dims[1] * pixelsize )

# define a simple box region.
box = gdcm.BoxRegion();
for z in range(0, dims[2]):
  # Define that I want the image 0, full size (dimx x dimy pixels)
  # and do that for each z:
  box.SetDomain(0, dims[0] - 1, 0, dims[1] - 1, z, z);
  #print( box.toString() );
  reader.SetRegion( box );

  # reader will try to load the uncompressed image region into buffer.
  # the call returns an error when buffer.Length is too small. For instance
  # one can call:
  # uint buf_len = reader.ComputeBufferLength(); // take into account pixel size
  # to get the exact size of minimum buffer
  if reader.ReadIntoBuffer(buffer):
    open('/tmp/frame.raw', 'wb').write(buffer)
  else:
    #throw new Exception("can't read pixels error");
